AB DE-ION Circuit Breakers

Circuit Breaker Time/Current Curves (Phase Current)
Series C[®] N-Frame Circuit Breakers
Equipped With Type NES Digitrip RMS 310 Trip Units
 The NES Digitrip RMS 310 Trip Units are AC only devices that employ microprocessor based technology that provides true RMS current sensing means for proper correlation with thermal characteristics of conductors and equipment. They are used with Circuit Breaker Types ND, CND, HND, CHND, NDC, and CNDC.

Notes
 Curve accuracy applies from -20°C to +55°C ambient. For possible ampere derating for ambient above 40°C, refer to Cutler-Hammer.
 Digitrip RMS 310 trip units are suitable for functional field testing with test kit Cat. No. STK2. For field testing using primary injection methods, follow NEMA publication AB-4-1991.
 For ground fault time-current curves see SC-5377-92A.

① There is a memory effect that can act to shorten the long delay. The memory effect comes into play if a current above the long delay pickup value exists for a time and then is cleared by the tripping of a downstream device or the circuit breaker itself. A subsequent overload will cause the circuit breaker to trip in shorter time than normal. The amount of time delay reduction is inverse to the amount of time that has elapsed since the previous overload. Approximately five minutes is required between overloads to completely reset the memory.
 ② For high fault current levels a fixed instantaneous override is provided at 14000A (Tolerance ±15%).
 ③ The end of the curve is determined by the interrupting rating of the circuit breaker. See above tabulation.
 ④ Not UL/CSA Listed.
